Canon sold on 'Flash'!

Canon Australia have a large IT footprint which services their business across Oceania.

Like all companies they are often challenged by IT performance, time and budget.

More recently they decided to replace their existing Computer Storage System and decided to look at the options available in the market. Their current SAN solution was end of life and they also wanted to accommodate for growth.

This exercise was led by Luke Clark, CIO and Neil Elson, Manager – Enterprise Operations and Infrastructure Delivery.

Luke and Neil wanted to review new technology as part of the process.

The Flash technology from Pure Storage was recommended by Harbour IT but also on their radar because of some research done by one of their technical team members.

Their experience has been a very good one.

To get the best out of the pure Storage system, they also had to upgrade some of their switching fabric. Neil said “we now have significant performance gains over our old systems. The disk to disk backup improved from 6 hours to about 3 hours and we are getting compression of about 8 to 1”

Luke and Neil have been more than happy with their experience with Pure to date and have recently ordered a capacity upgrade.

“Flash” now has more than one meaning at Canon!
